I.--INTRODUCTION

The data in this report were obtained from the Veterans Administration, Department of Medicine and Surgery. They represent a 20 percent systematic random sample of all psychiatric patients resident in the Veterans Administration hospitals as of midnight, November 30, 1959.

This report provides basic data on the numbers and characteristics of hospitalized mental patients in Veterans Administration hospitals. Any study of mental hospital resident patient data can be seriously biased by the omission of data on patients admitted to these facilities. This is particularly true in studies of changes in sex-specific resident patient rates over the years. For example, in 1958 there were 58,485 male veterans with psychiatric disorders in Veterans Administration hospitals as compared to 264,302 males in state and county mental hospitals. Among all the male patients with schizophrenic reactions hospitalized in the state and county mental hospitals and in the Veterans Administration hospitals combined at the end of 1958, 26.3 percent were in the Veterans Administration hospitals. Approximately 36.6 percent of the males in these hospitals in the age groups 25-44 and 55-64 were in Veterans Administration hospitals. Thus, interstate comparisons of data on hospitalized mental patients provide a biased picture unless data on the Veterans Administration hospitals are included.

II.--COVERAGE

This report includes data on patients hospitalized at midnight November 30, 1959 in Veterans Administration hospitals located in the United States only. This includes neuropsychiatric hospitals and the psychiatric facilities of the general medical and surgical hospitals. All data are based on veterans who are residents of the continental United States.

A 20 percent systematic random sample was used to represent the characteristics of the entire patient population. However, the data presented in this publication have been multiplied by a factor of five to represent 100 percent.
